

# **A REVIEW OF SOME REQUIREMENTS FOR DROUGHT INFORMATION ON THE CANADIAN PRAIRIES**

Richard Lawford, Irene Hanuta, Harvey Hill, Alf Warkentin,  
Elaine Wheaton, Ron Stewart, Bill Girling

CMOS/CGU Congress  
May 31, 2007  
St John's Newfoundland

**Drought** a deficiency of precipitation from expected or “normal” that, when extended over a season or longer, is insufficient to meet the demands of human activities and the environment.

**Drought is often difficult to address because:**

- It is a slow-onset, creeping phenomenon.
- It means different things in different sectors (E.g. agriculture, hydrology, forestry, etc) without a universal definition.
- Its impacts are non-structural and spread over large areas.

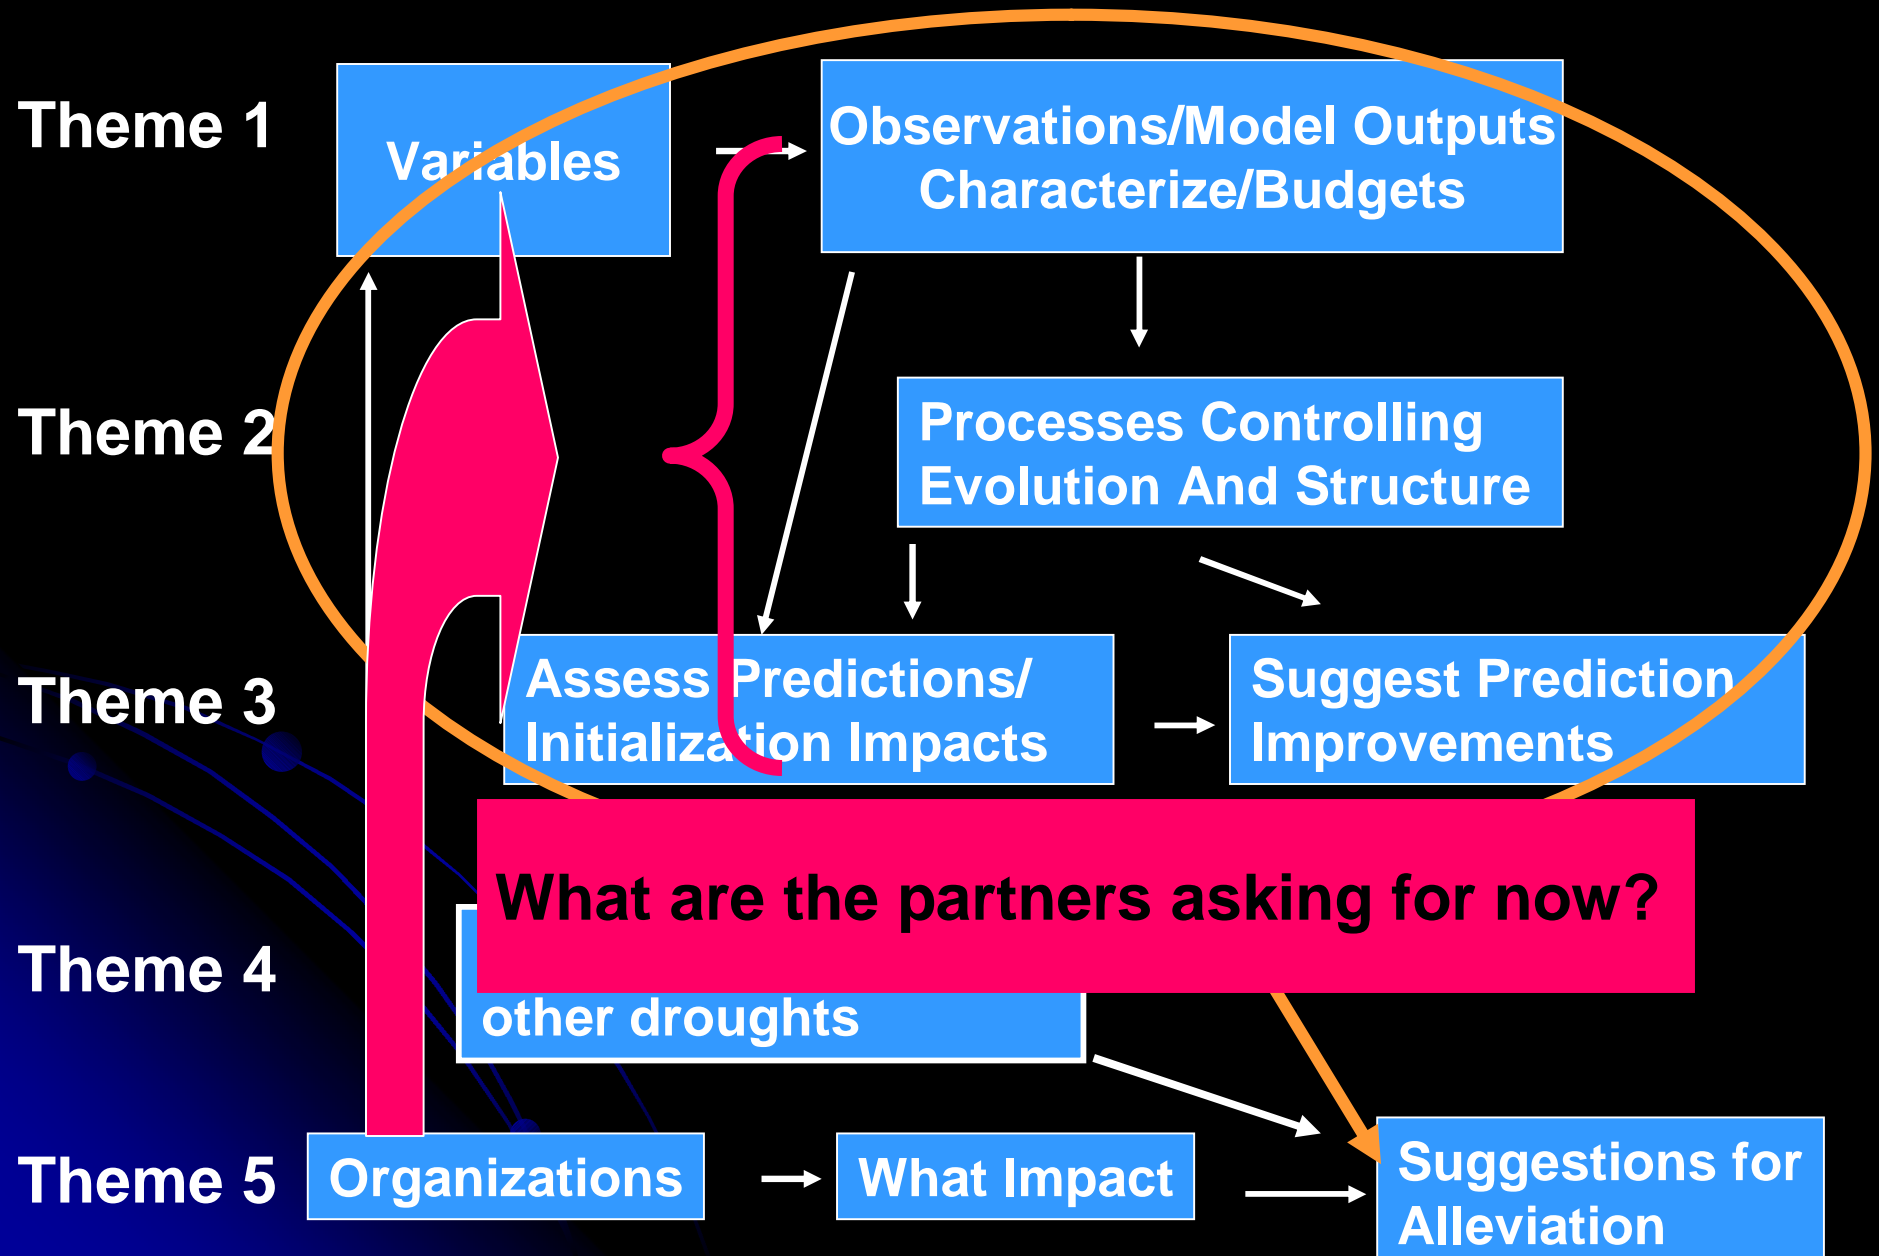

**RESULT**, adoption rate for drought mitigation/preparedness planning has lagged other natural hazards

# Drought is the most Costly Natural hazard in Canada (after Hanuta)

Disaster	Year(s)	Location	Cost (billions 1999\$)
Drought	1980	Prairies	5.8
Freezing Rain	1998	Ontario to New Brunswick	5.4
Drought *	2001/2002+/-	National	5.0
Drought	1988	Prairies	4.1
Drought	1979	Prairies	3.4
Drought	1984	Prairies	1.9
Flood	1998	Saguenay, Quebec	1.7
Flood	1950	Winnipeg, Manitoba	1.1
Drought	1931-38	Prairies	1.0
Drought	1989	Prairies	1.0
Hailstorm	1991	Calgary, Alberta	1.0

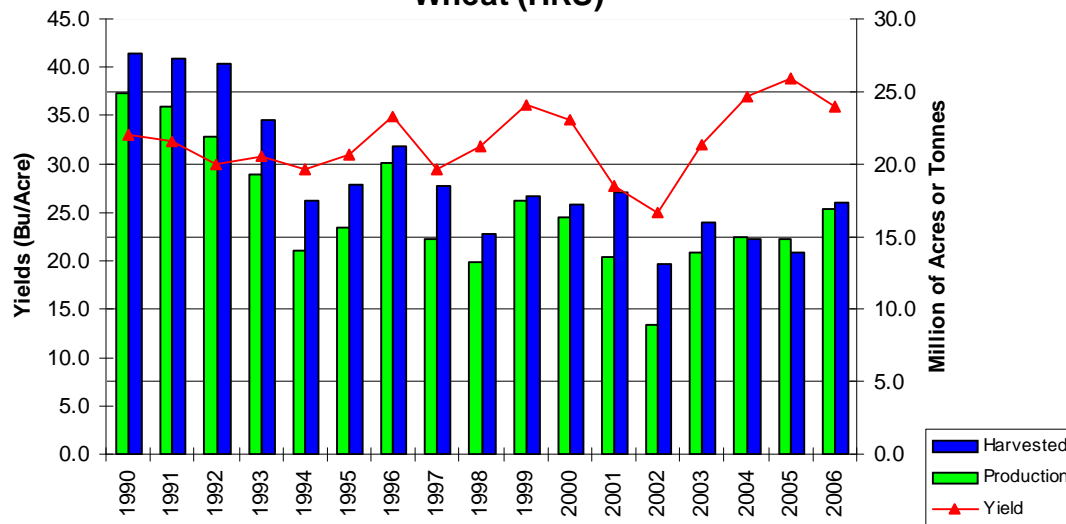

Source: An assessment of natural hazards and disasters in Canada: A report for decision-makers, 2004

# DRI DELIVERABLES AND INTEGRATION OF THEMES

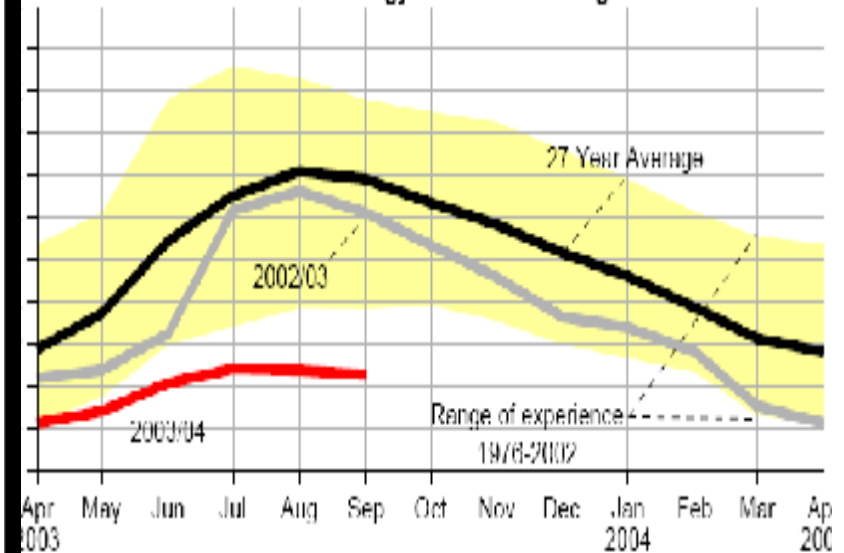

To get feedback on Partner needs and expectations, DRI has formed a Partners' Advisory Committee (PAC) that reports to its Board of Directors.

**Production, Harvested Area and Yields for Spring Wheat (HRS)**

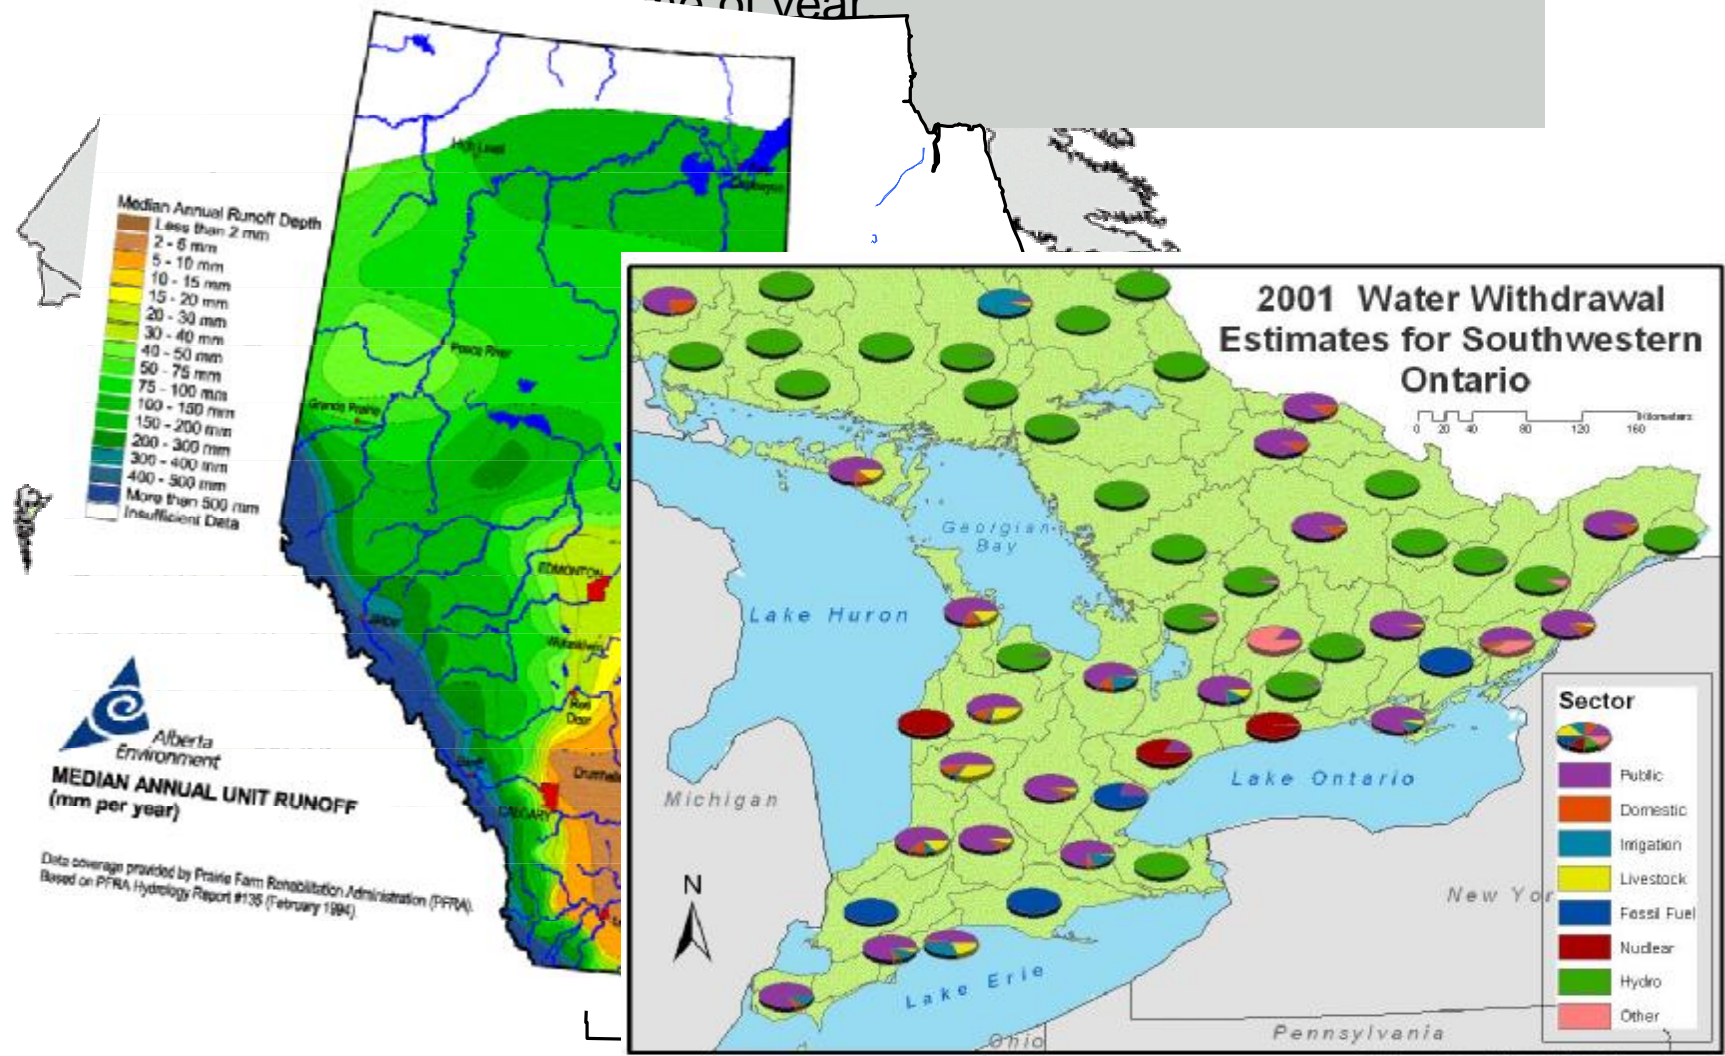

**Nelson-Churchill Drainage Basin  
Manitoba Energy in Reservoir Storage**

This Committee has representation from PFRA, Saskatchewan Watershed Authority, Manitoba Water Stewardship, Saskatchewan Research Council, Alberta Environment (TBC), Manitoba Hydro, Saskatchewan Agriculture, Alberta Agriculture (TBC).

# FACTORS FOR CONSIDERATION IN DROUGHT PROGRAMS

The requirements for drought information vary according to climate, water use, and regional water infrastructure.

# Why PFRA is developing a Drought Strategy?

- **No existing national drought strategy for medium- to long-term**
  - Sustain environment & economy
  - Stay competitive
- **Drought is a business risk to be managed (coordinated efforts with provinces to reduce impacts and vulnerability)**
- **Prepare for long-term climate change**
- **Prepare for potential increasing variability (now and in the future)**
- **Provide a planned approach to developing tools to reduce impacts (now 88 programs)**
  - Build on current activities that work
  - Develop and implement new activities

# LESSONS LEARNED REGARDING DROUGHT PLANS (A provincial perspective)

- ◆ Every drought is different
- ◆ Every community responds differently
- ◆ Drought Management Plans must be specific to the community
- ◆ Local Drought Management Team is key
- ◆ Drought Management Plans must contain sufficient detail that anyone can follow them
- ◆ Drought Management Plans must be practiced to find the flaws

"And it never failed that during the dry years the people forgot about the rich years, and during the wet years they lost all memory of the dry years. It was always that way."

- John Steinbeck, East of Eden

## Some Provincial Impacts of Drought

Province	Agriculture	Other	Plans
BC	Yes	Hydro	Draft Plan
Alberta	Yes	Energy, Dev	Plan since 2002
Saskatchewan	Yes	Energy	Draft Plan
Manitoba	Yes	Hydro	Diverse Pgms
Ontario	Yes	Transp., Rec	Diverse Pgms
Quebec	Yes	Hydro	Diverse Pgms
PEI	Yes	_____	_____
N. Brunswick	Yes	_____	_____
Nova Scotia	Yes	_____	_____
Newfoundland	Maybe	_____	_____

## Examples of Actions to reduce vulnerabilities

*“Activities implemented in advance of drought to reduce it’s negative effects”*

- 1) Water supply development (dams, reservoirs and pipelines),
- 2) water management (water transfers),
- 3) water conservation and education programs (US WaterWiser program),
- 4) land management initiatives (reduce land in production, use wetlands for forage cropping),
- 5) economic and social empowerment (community management councils)
- 6) Livestock management (community pastures, downsizing the herd)
- 7) Federal and provincial government support programs.

## Manitoba Hydro must plan for the Impact of drought in many basins

**It frequently takes 9 to 12 months to seriously draw down a reservoir to the point where a continued drought affects production.**

Saskatchewan

Lower Churchill

Nelson River Local

Winnipeg

Red

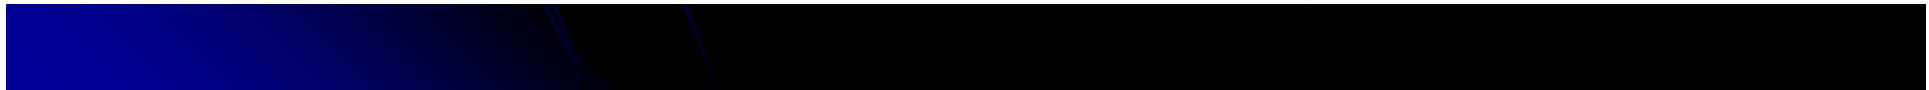

Source of most of  
Manitoba Hydro's  
generating capacity.

Montana

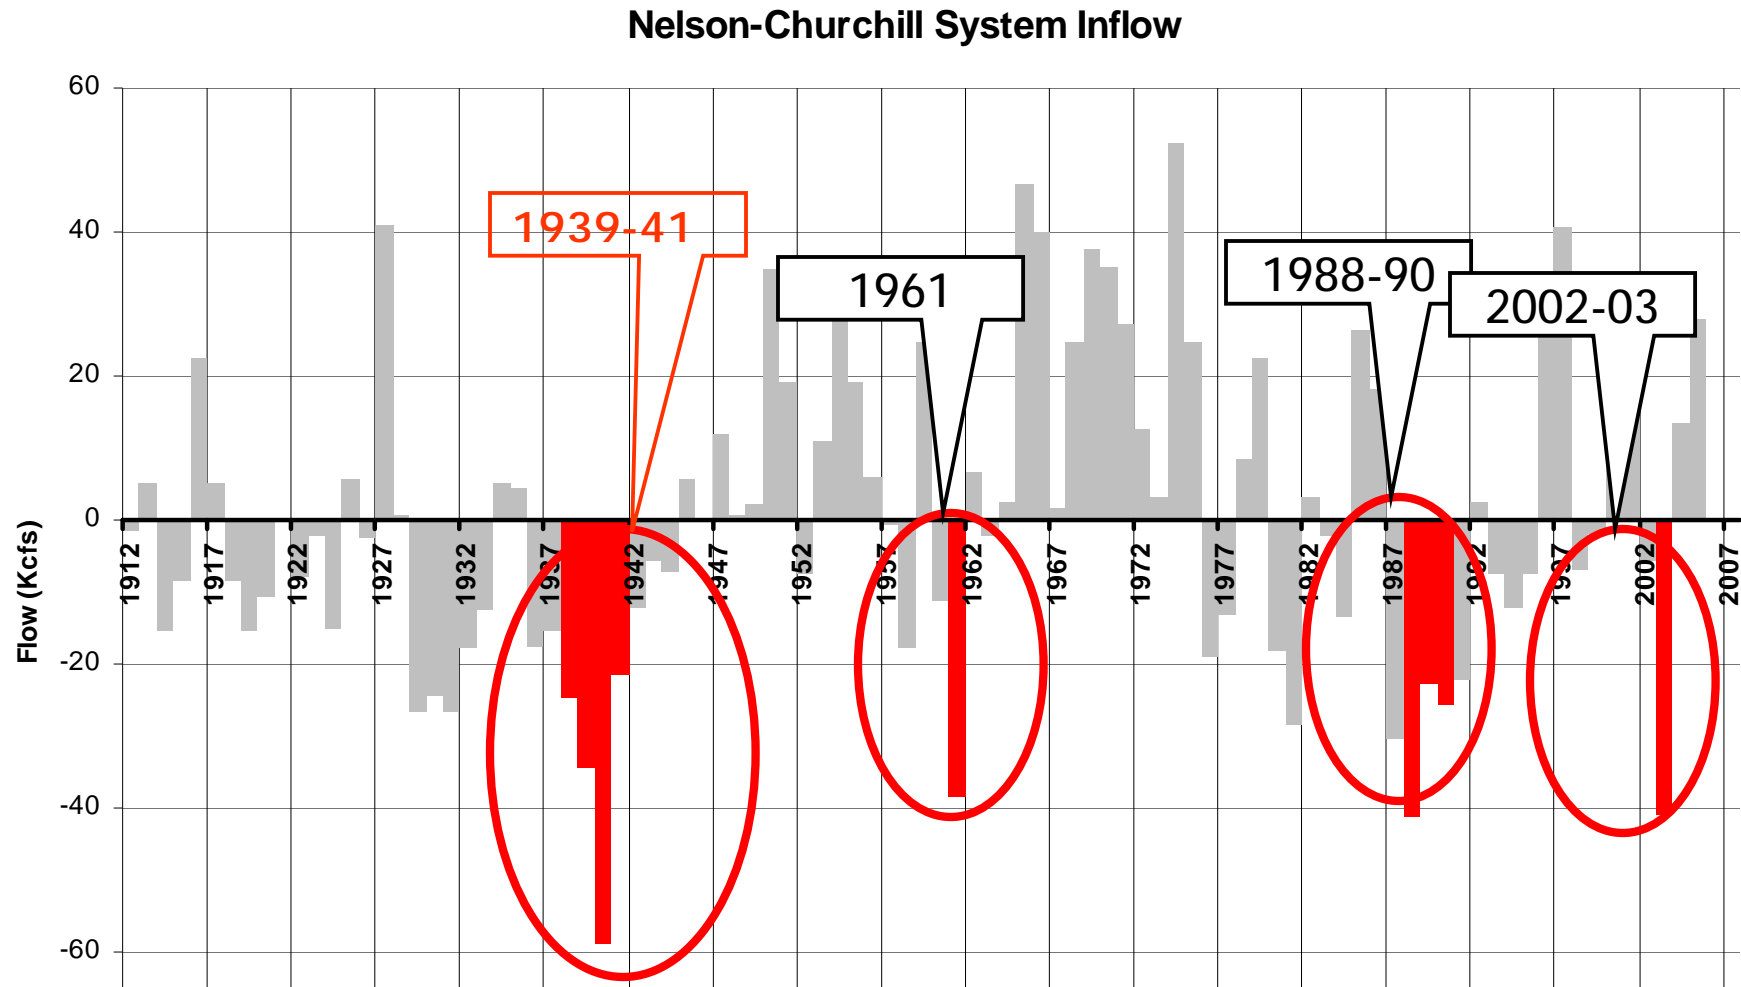

North Dakota

South Dakota

Minnesota

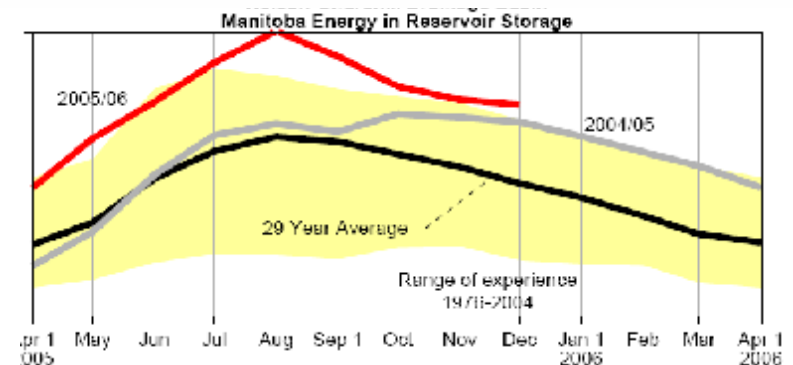

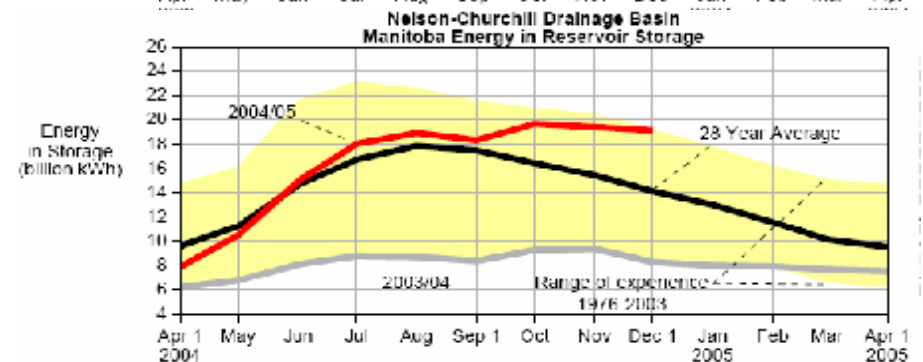

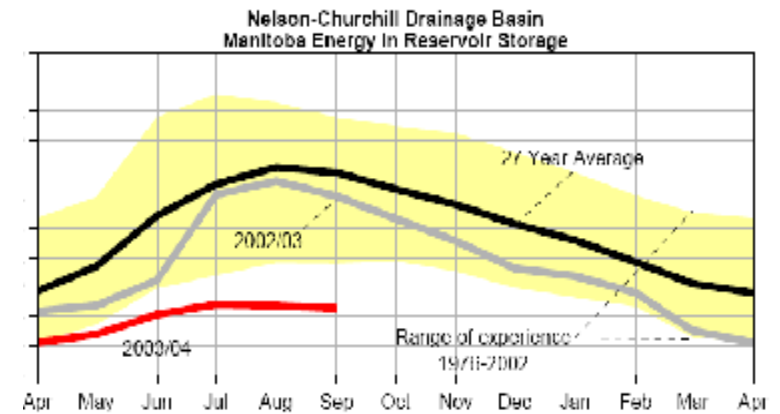

# Historical Drought of Record

**The Manitoba Hydro challenge is to define the drought of record so they can plan sufficient capacity to ensure they will be able to supply the firm demand even under the worst conditions.**

- Internal risk assessment & sensitivity analyses of more severe drought
- The 2003 to 2005 period represents the single most significant transition from system-wide drought to flood in history
- Climate change or variability?

$$\text{Risk} = \text{Threat} \times \text{Vulnerability}$$

The climate factor

The contextual factor: economic condition, farm capabilities, flexibility to accept alternatives for cropping, destocking, etc.

Drought is a major risk for producers in many parts of the Canadian prairies. The agricultural community is looking for inputs from DRI that will help them reduce their risk.

# Drought Characterization is an important step in drought mitigation plans

## North American Drought Monitor

April 30, 2007  
Released: Wednesday, May 16, 2007

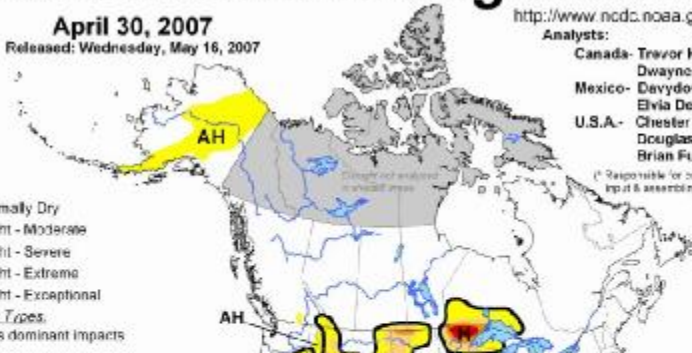

<http://www.ncdc.noaa.gov/nadm.html>

Analysts:

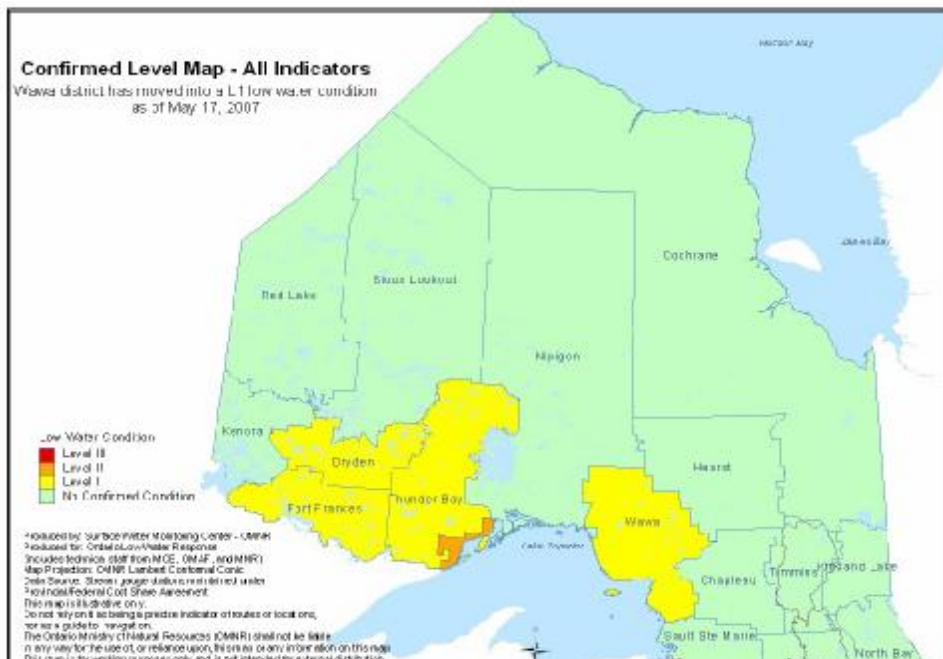

Canada- Trevor Hadwen  
Dwayne Chobanik  
Mexico- Davydova Valentina  
Elvia Delgado Diaz  
U.S.A.- Chester Schmitt  
Douglas La Combe  
Brian Fuchs

(\* Responsible for collecting analysts input & assembling the NADOM map)

Intensity:  
D0 Abnormally Dry  
D1 Drought - Moderate  
D2 Drought - Severe  
D3 Drought - Extreme  
D4 Drought - Exceptional  
Drought Impact Types:  
Delineates dominant impacts

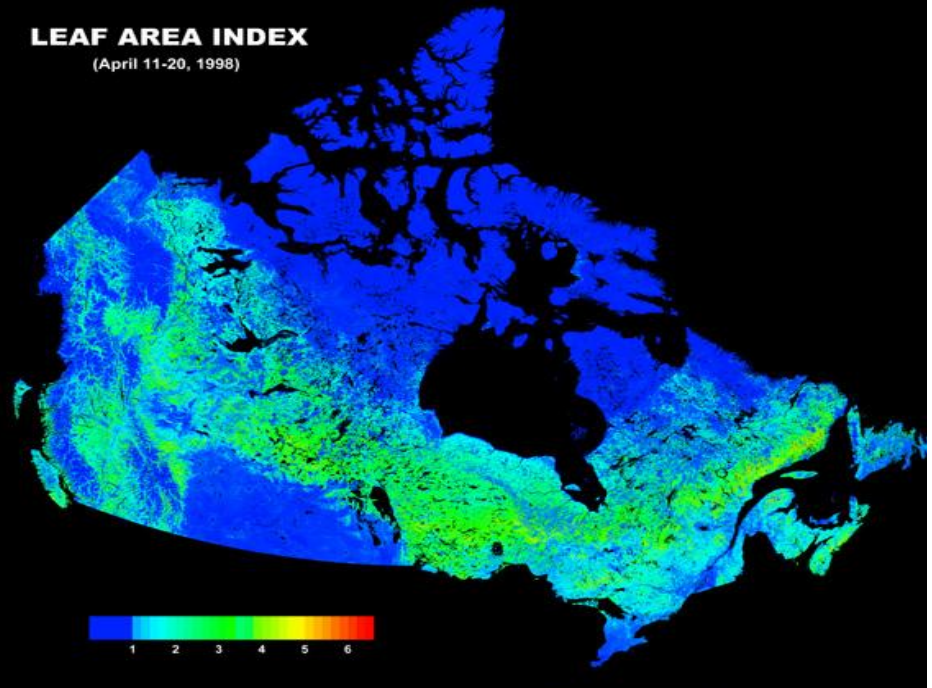

Moisture Status for Forage and Wheat in Manitoba from Season to July 6, 2003

DRI Theme 1 directly addresses the concerns of the agriculture community for ways to characterize the extent and severity of drought.

## LEAF AREA INDEX

(April 11-20, 1998)

# Examples of the use of Indicators of Drought

DRI analysis can help to define the thresholds for drought. Some provinces already use objective criteria based on data and science.

## Alberta :

*extremely low*

*very low*

*low*

*moderately low*

*near normal*

*moderately high*

*high*

*very high*

*extremely high*

drier less than 1 in 25-years

drier less than 1 in 12-years

drier less than 1 in 6-years

drier less than 1 in 3-years

every 1 in 3-years

wetter less than 1 in 3-years

wetter less than 1 in 6-years

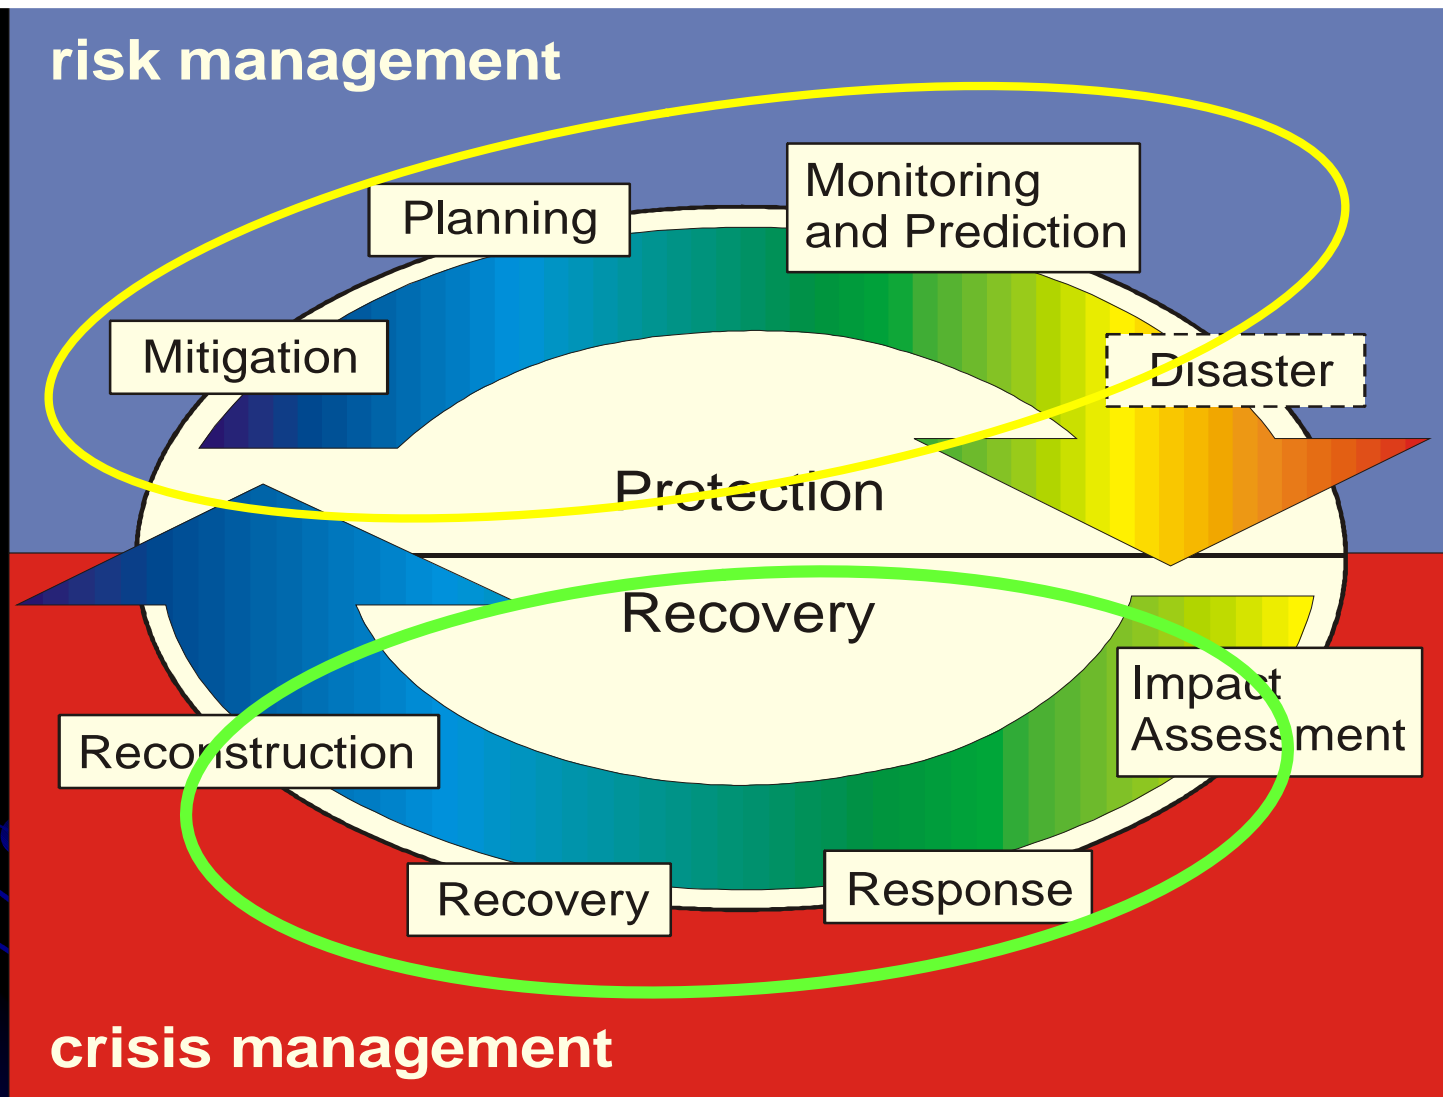

wetter less than 1 in 12-years

wetter less than 1 in 25-years

## But there are obstacles in this process:

For very extreme events legislators are often reluctant to declare the worst level (even when the data show that exists) because of the substantial commitments that are required to help affected people. Some provinces appear to have failed to ratify agreements because they do not like to have payouts and actions triggered by decisions based on physical conditions.

# GOAL: Replace **Crisis management** by **risk management**

DRI and the climate community can help this transition by providing prediction capabilities, monitoring systems and knowledge needed to reduce vulnerabilities.

**Paleo-climate Proxy Records of climate**

**Deterministic,  
Within 2 weeks  
of forecast,  
Utilized Widely**

**Weather**

**Stochastic, Unpredictable,  
Pacific Decadal Oscillation**

**Stochastic,  
Primarily  
ENSO**

**Seasonal/Inter-  
Annual**

**Stochastic,  
GCMs**

**Centennial**

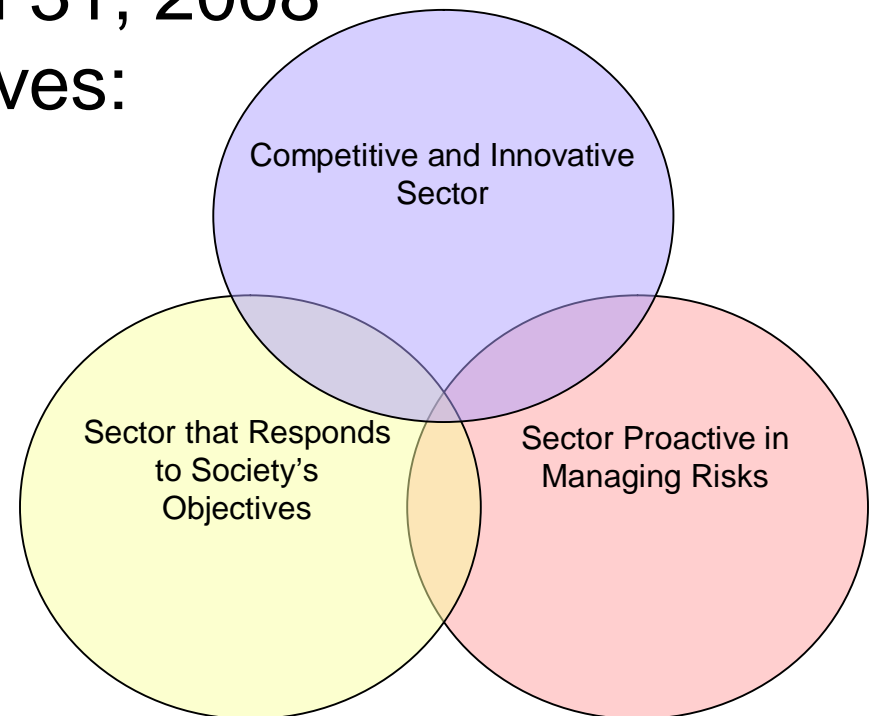

**Decadal**

**Time scales for Drought  
information**

# Present Opportunities: The Agriculture Policy Framework II is being developed

- Federal Provincial committees are developing the next generation of an updated agricultural policy framework.
- Expected to be ready by the time current framework expires March 31, 2008
- Focus on 3-policy objectives:

**How can DRI effectively incorporate drought monitoring and prediction Into this new policy framework?**

## **What Partners want from DRI (or any drought program)**

Better understanding of the causes of drought, its impacts and the factors that bring drought to an end.

Better forecasts of the onset, intensity, extent and termination of drought events.

Better understanding of drought processes (Evapotranspiration, land and hydrological process parameterizations, land use and wetlands).

An understanding of how the drought of 1999-2005 related to historical droughts (typical or atypical) and future droughts?

Understanding of droughts in specific watersheds for infrastructure planning.
