

Contributions to *Improved Processes and Parameterisation for Prediction in Cold Regions*

Richard Essery and **Dan Bewley**
Institute of Geography and Earth Sciences
University of Wales Aberystwyth

Contributions to *Improved Processes and Parameterisation for Prediction in Cold Regions*

Theme 1: Improved understanding of processes

- Radiation
- Turbulent transfer
- Snow redistribution

Theme 2: Parameterisation

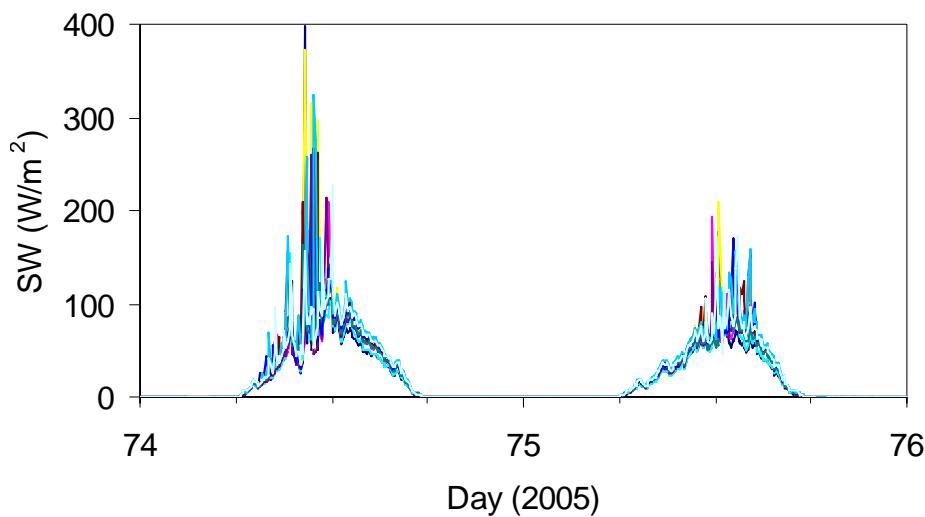

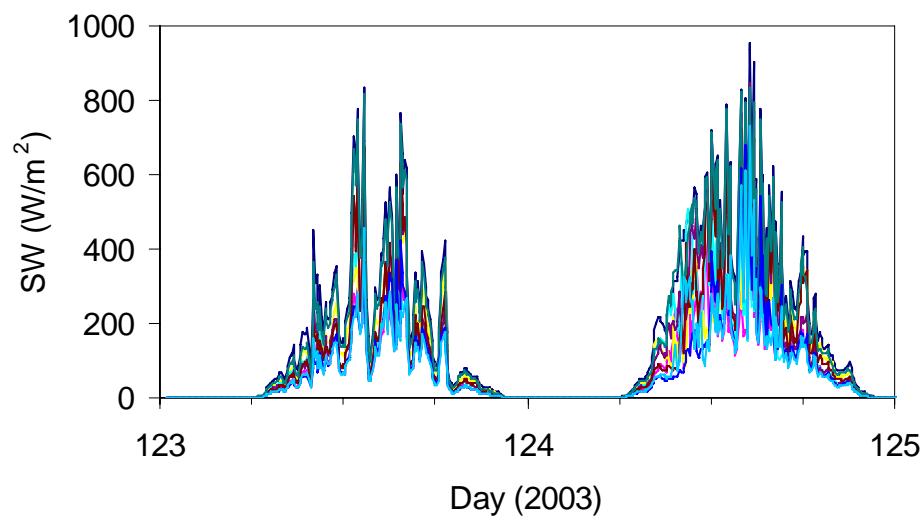

- Radiation
- Turbulent transfer
- Snow redistribution

Solar radiation to snow beneath shrubs and trees

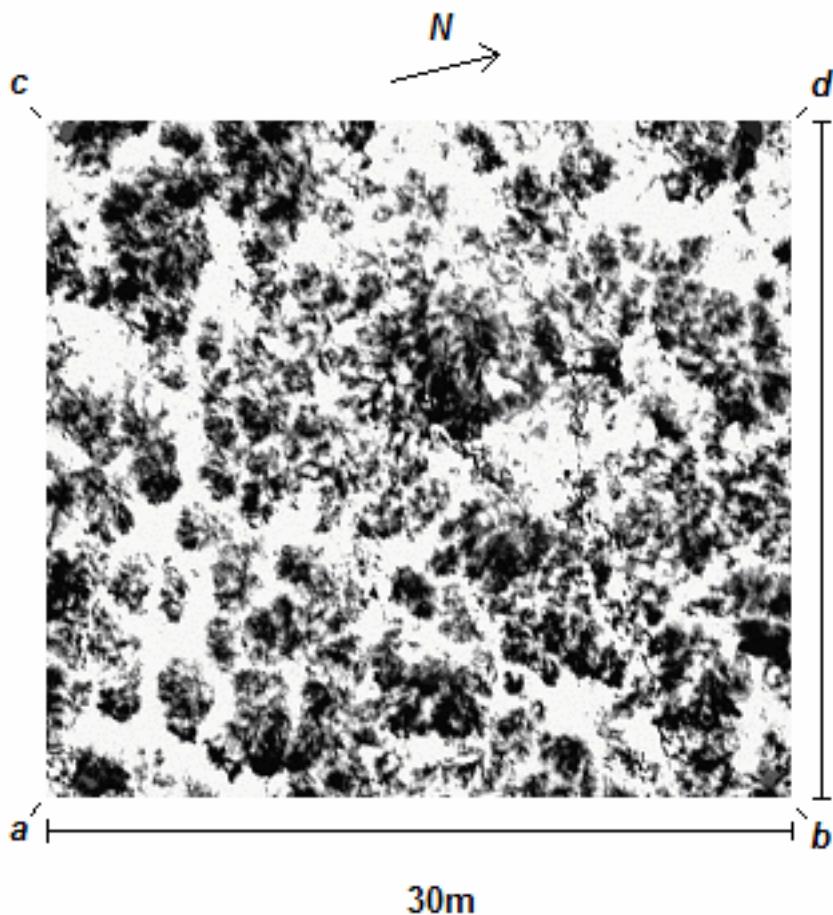

Wolf Creek shrubs

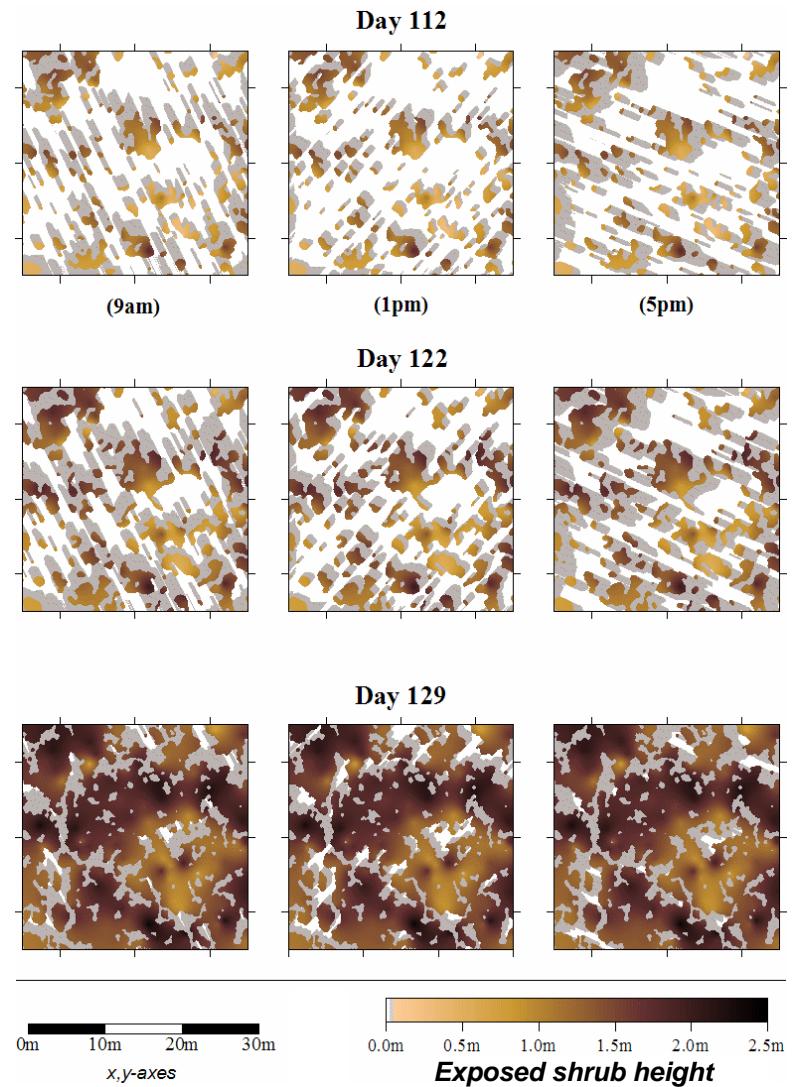

Marmot Creek level forest

Modelling solar radiation to snow beneath shrubs

Aerial photograph

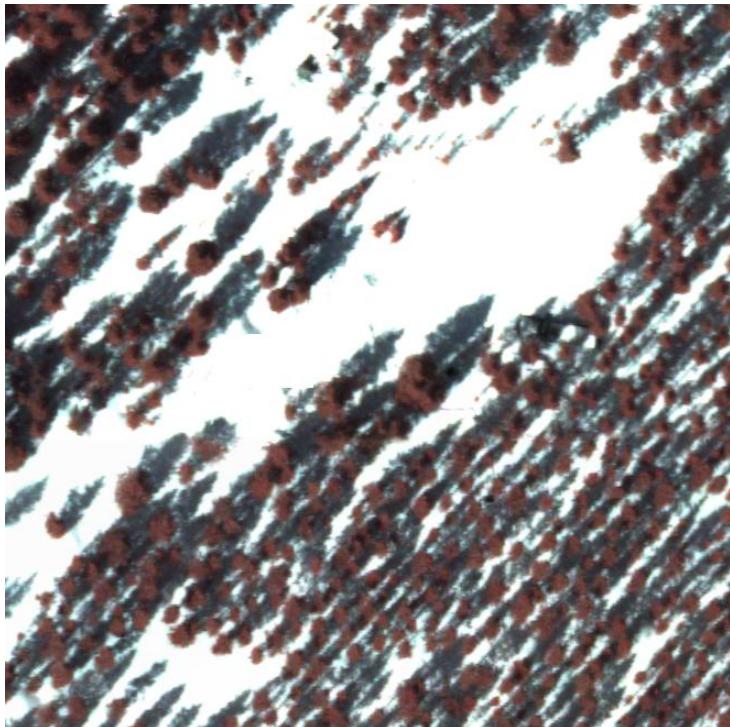

Shadow simulation

Bewley et al. (2006). *Arctic, Antarctic and Alpine Research*, in press

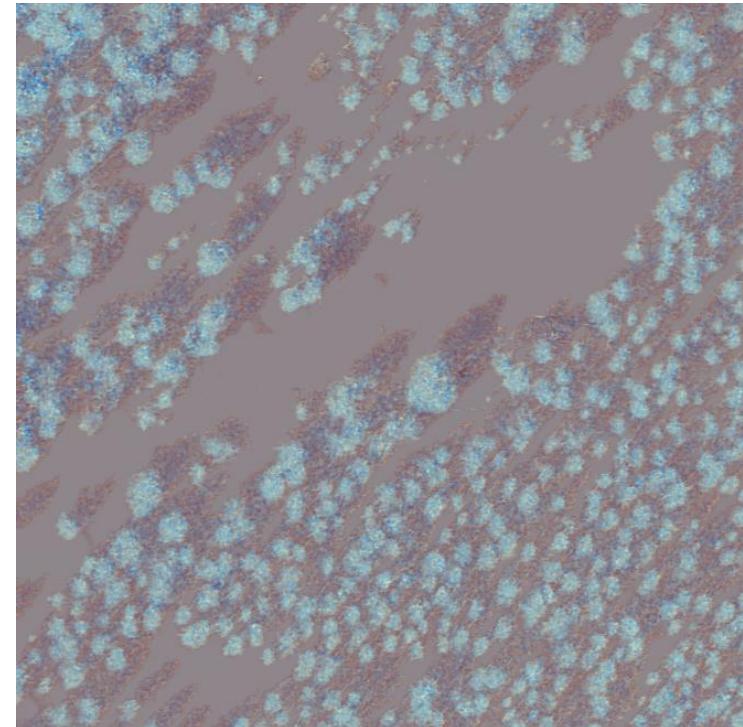

Mapping and modelling forest canopies

**Colour infrared orthophotograph
(lodgepole pine forest, Colorado)**

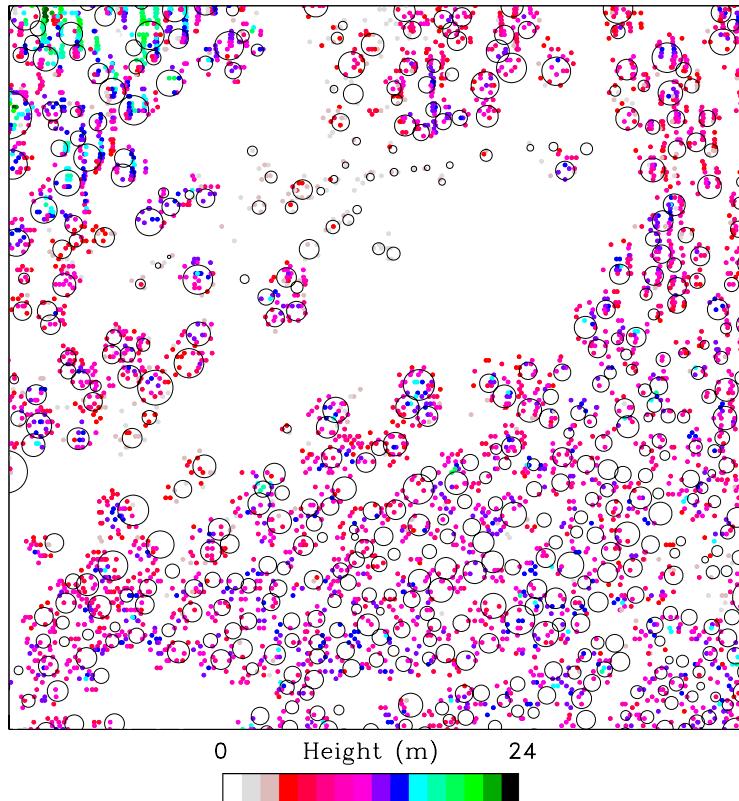

← 100 m →

Normalized difference index

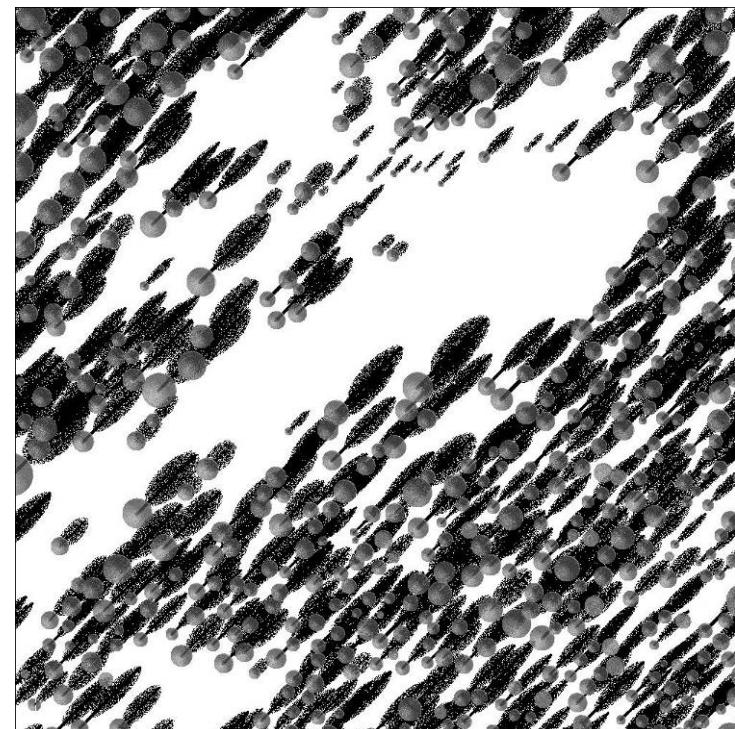

Mapping and modelling forest canopies

Lidar and canopy delineation

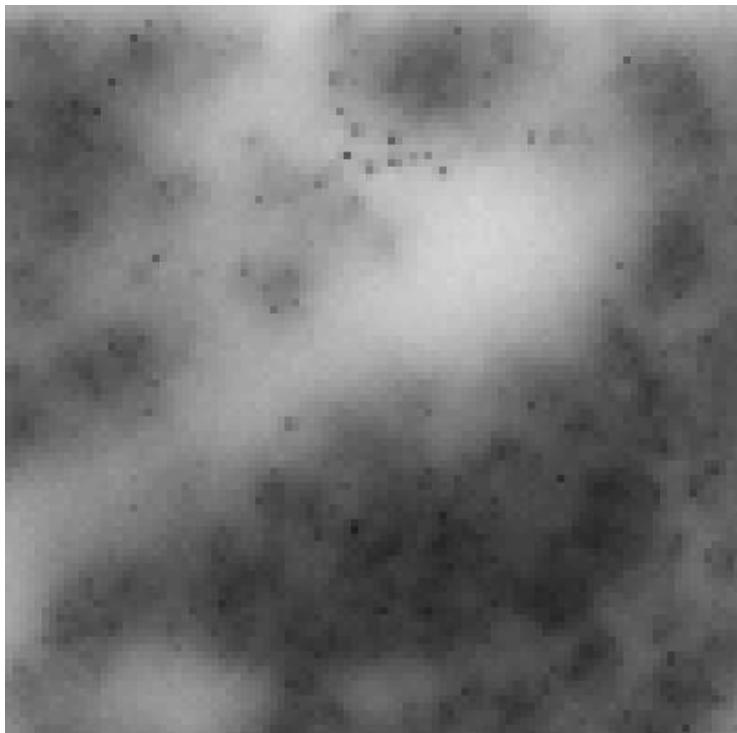

Shadow simulation

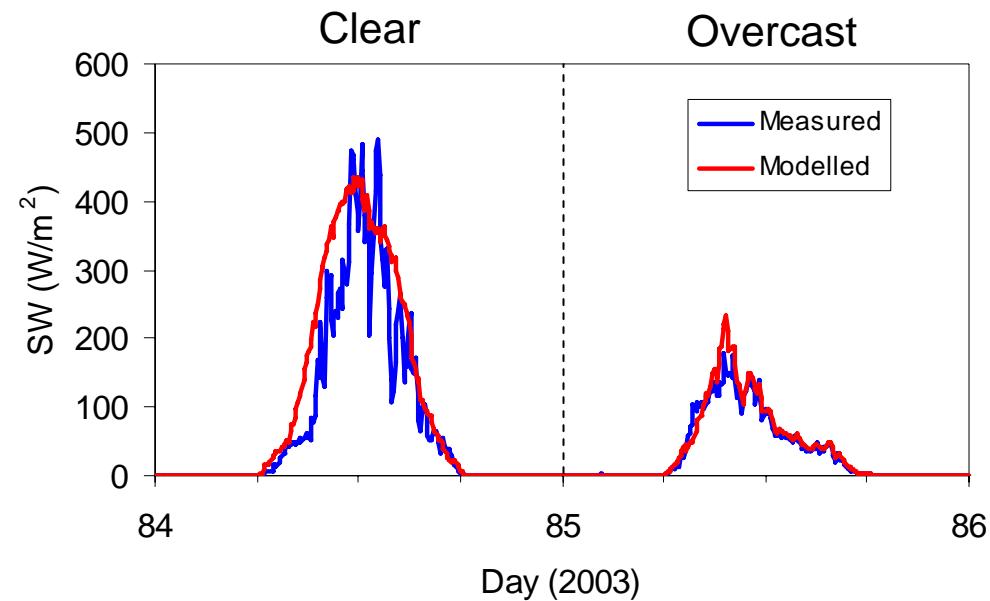

Essery et al. (2007). In preparation for *Journal of Hydrometeorology*.
Miller (2003). National Snow and Ice Data Center, digital media

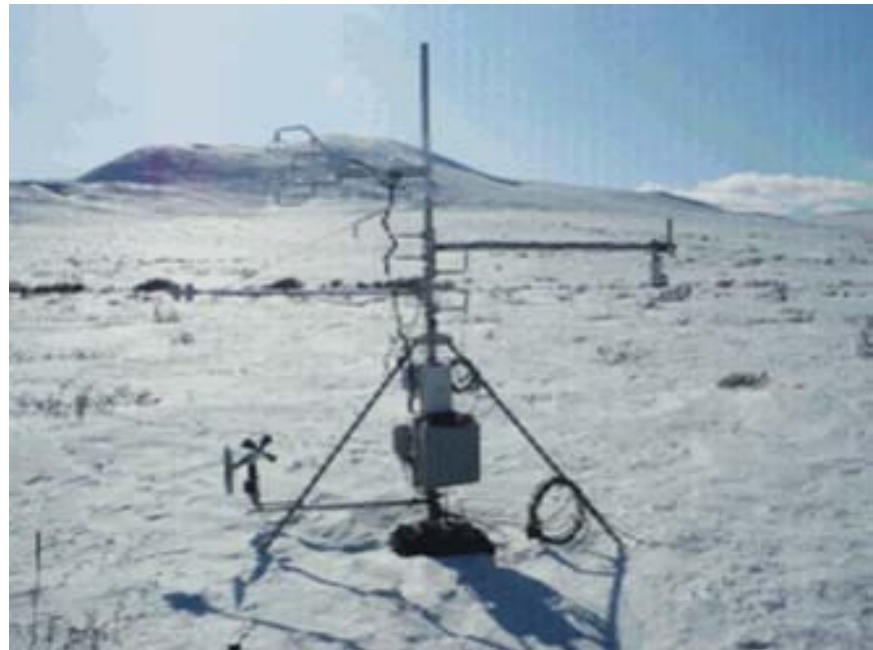

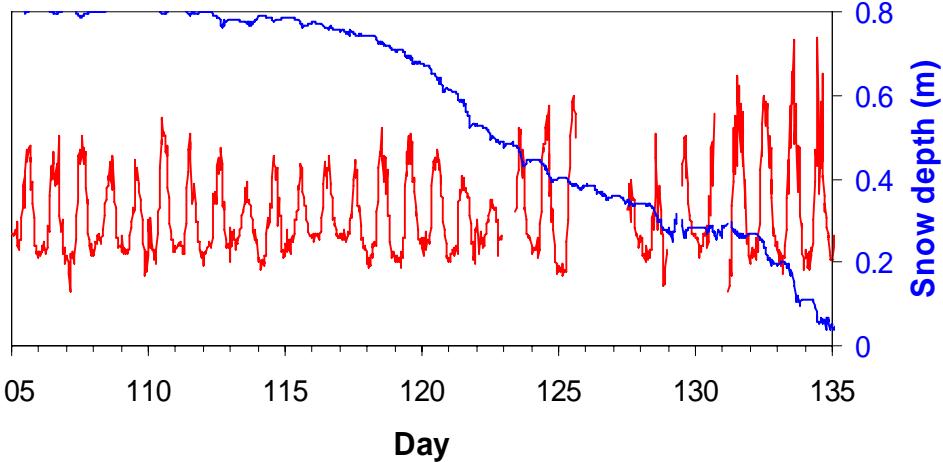

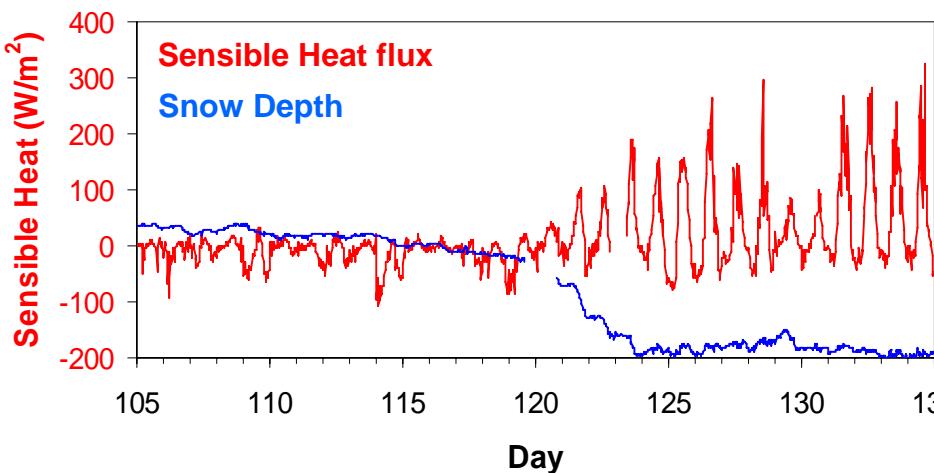

Modelling forest canopy transmission

Simulated skyview

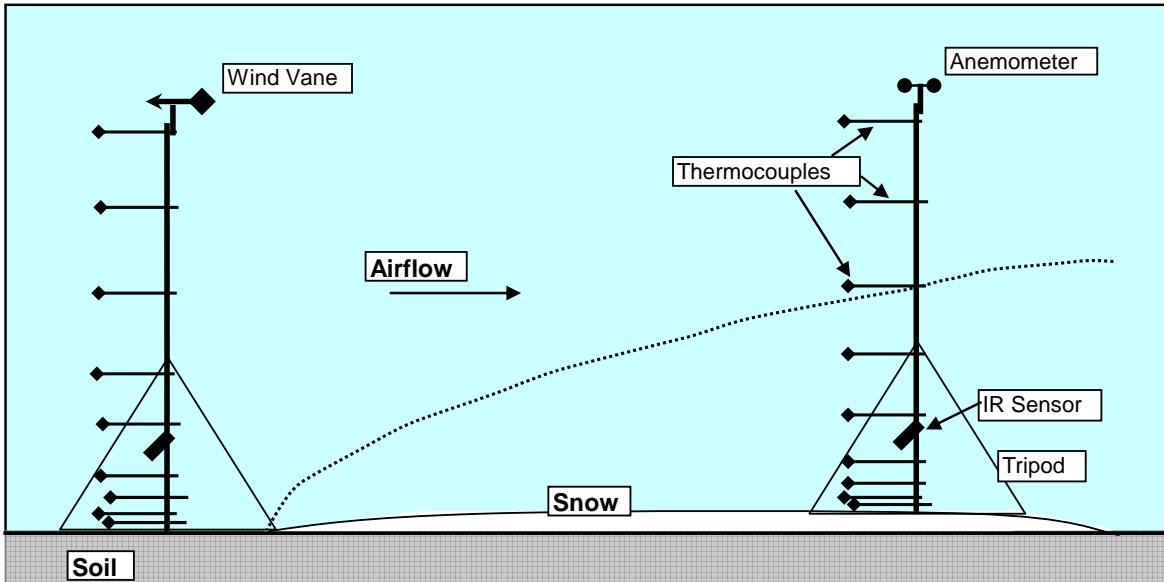

Simulated skyview

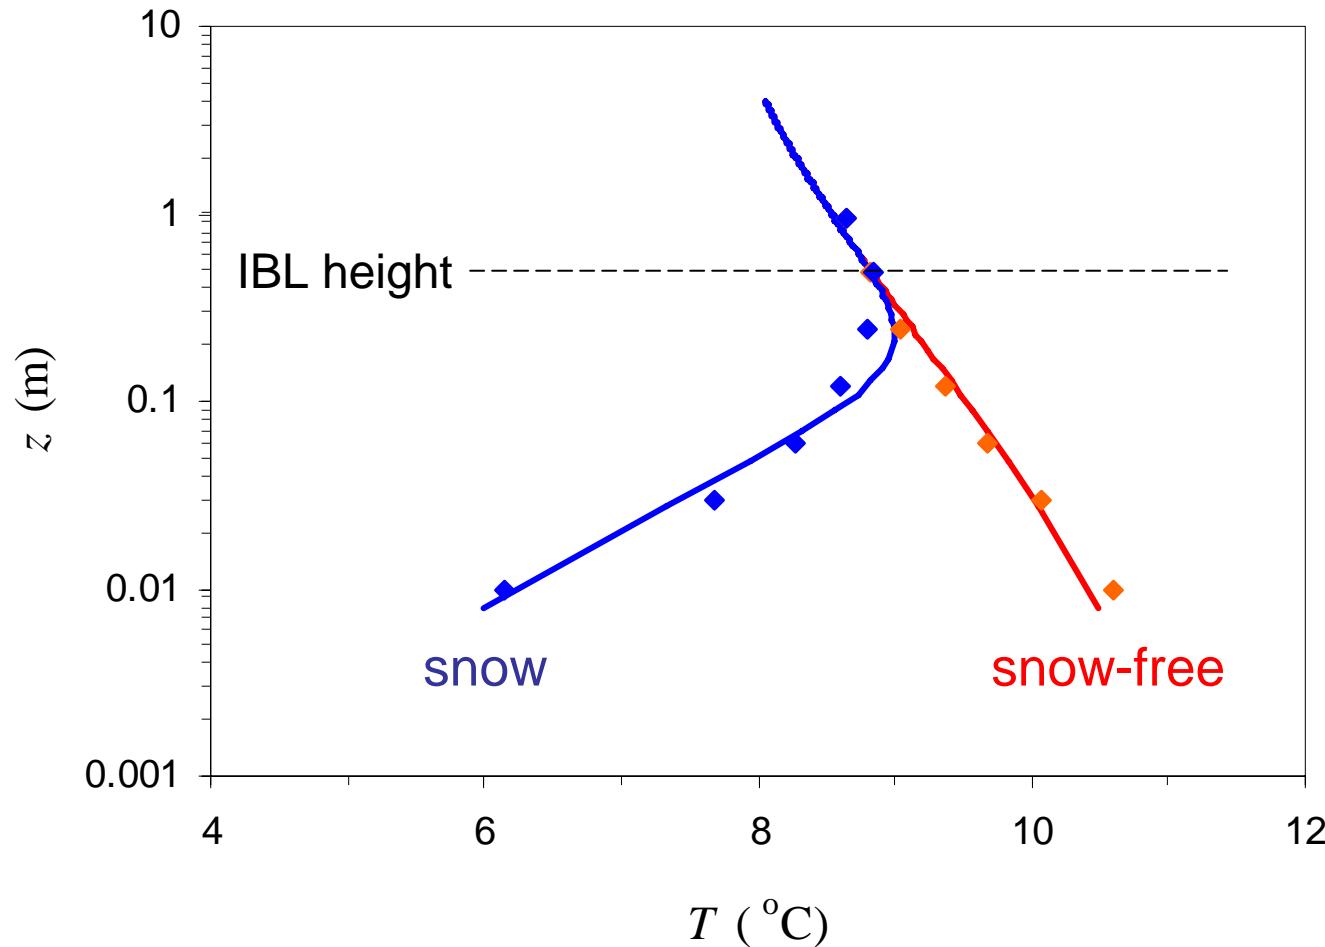

Granger Basin plateau**Granger Basin valley**

Advection of heat over patchy snow

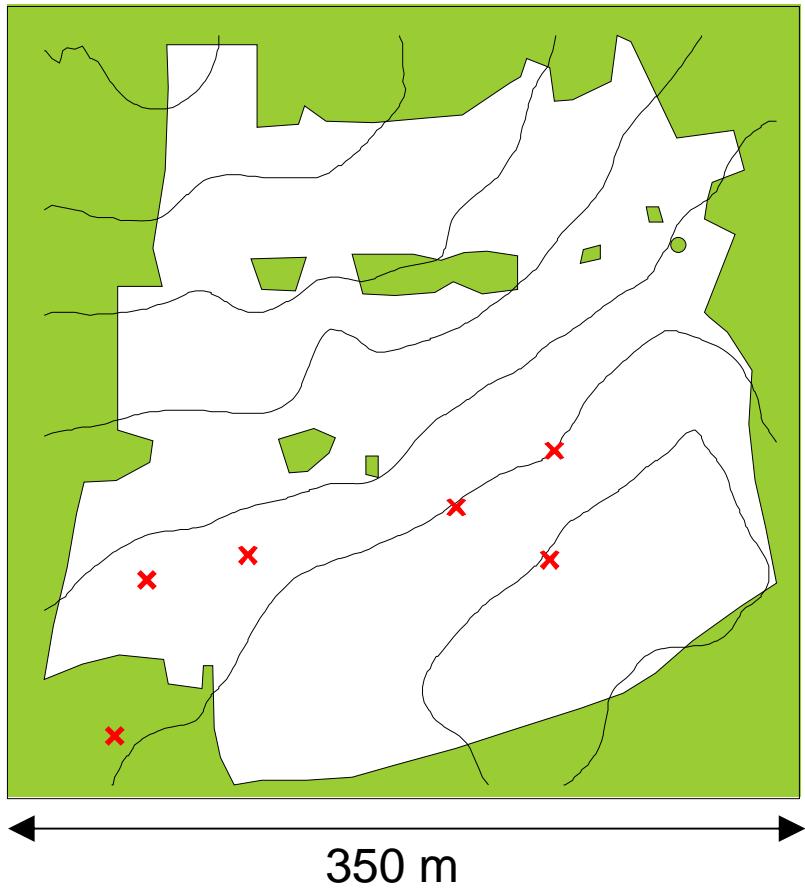

Measured and modelled temperature profiles

Turbulent development in clearings

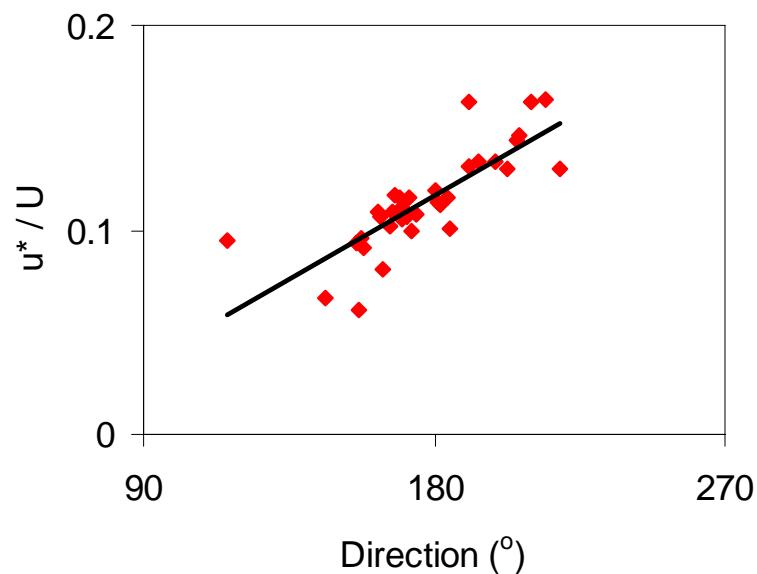

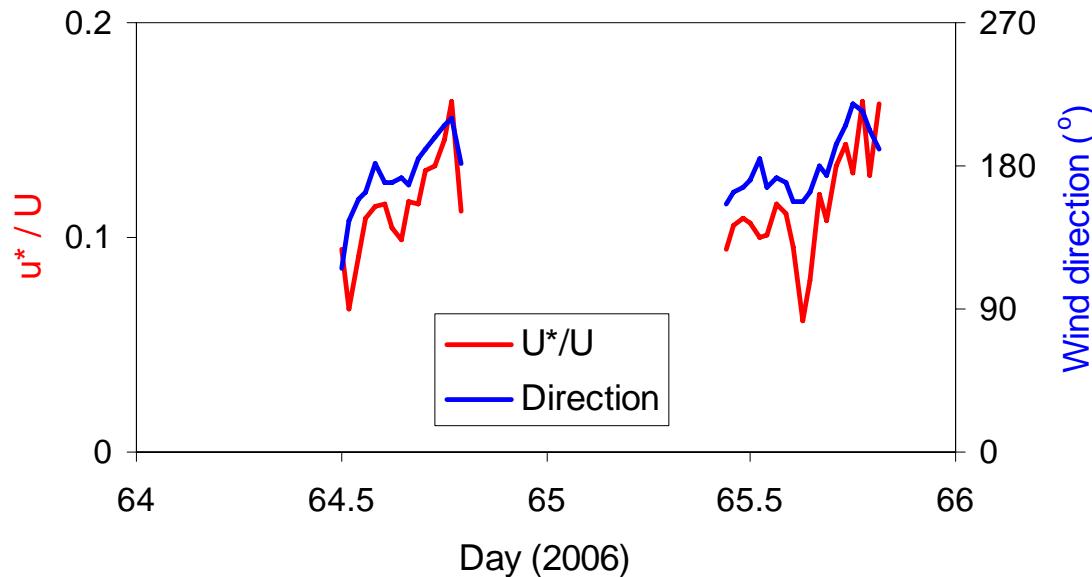

Hay Meadow EC profile locations

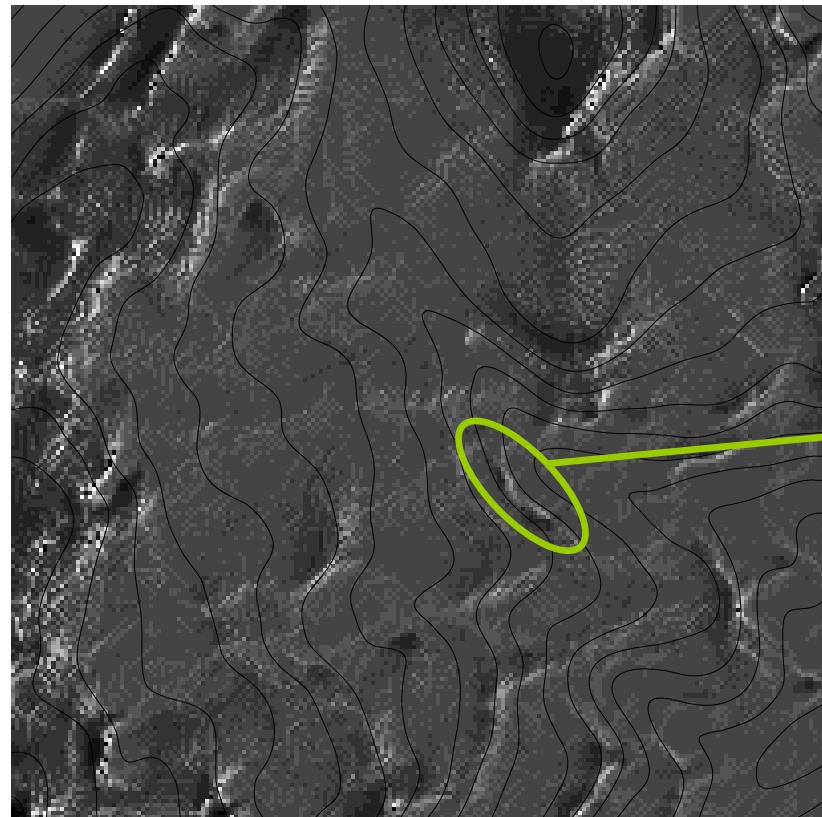

University of Saskatchewan EC sledge

Turbulent development in clearings

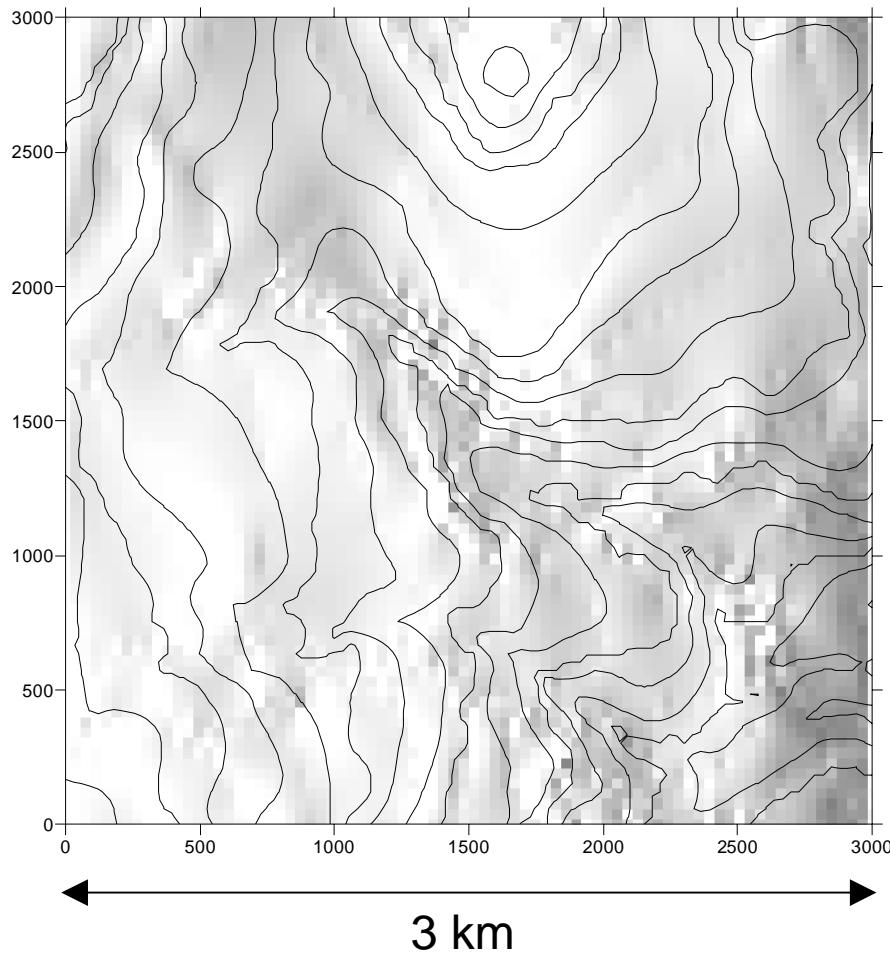

Simulation of Granger Basin slope drift

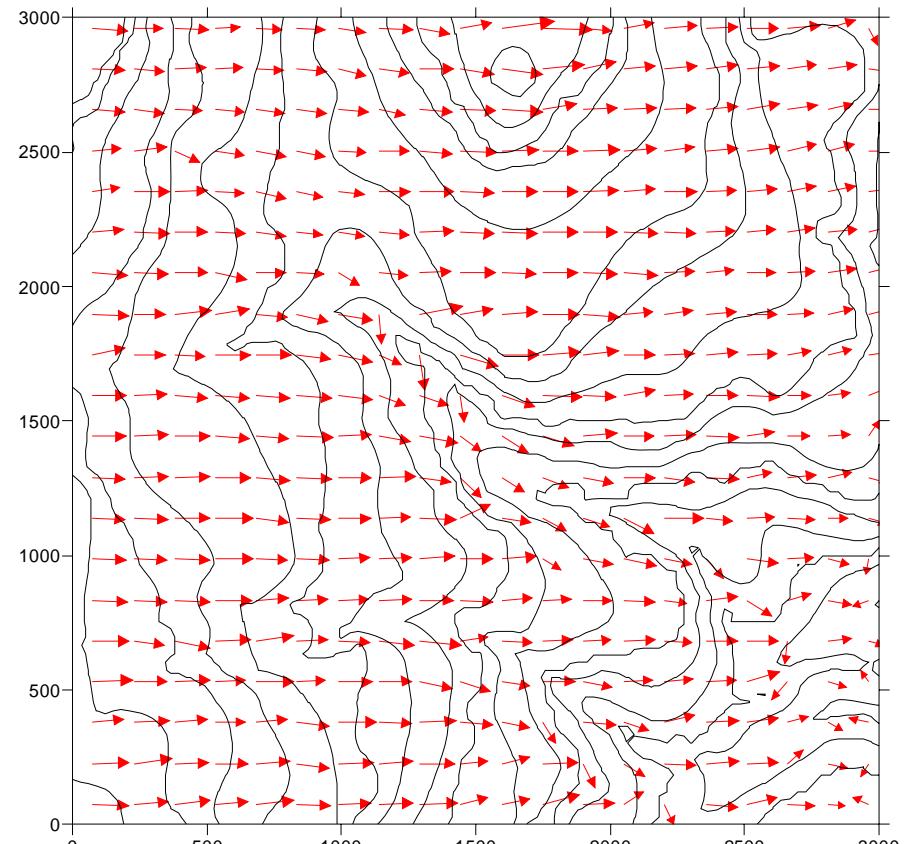

3 km

Linear simulation of westerly flow over Granger Basin

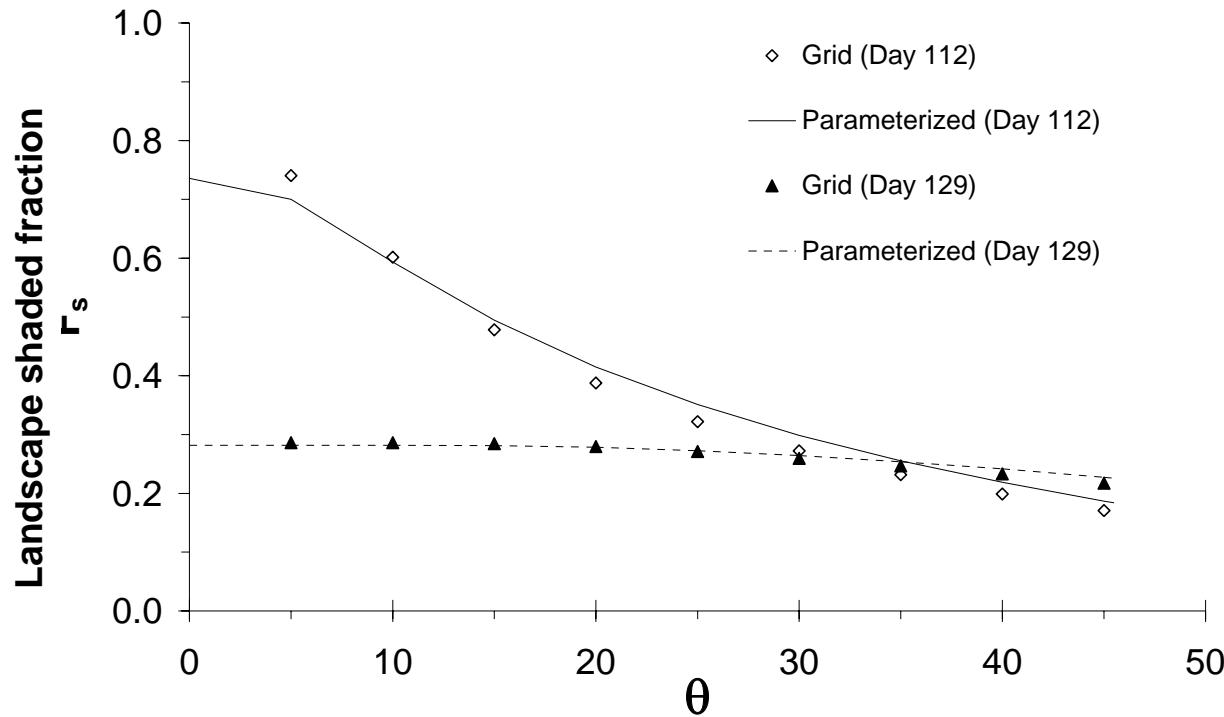

Windspeed

Direction

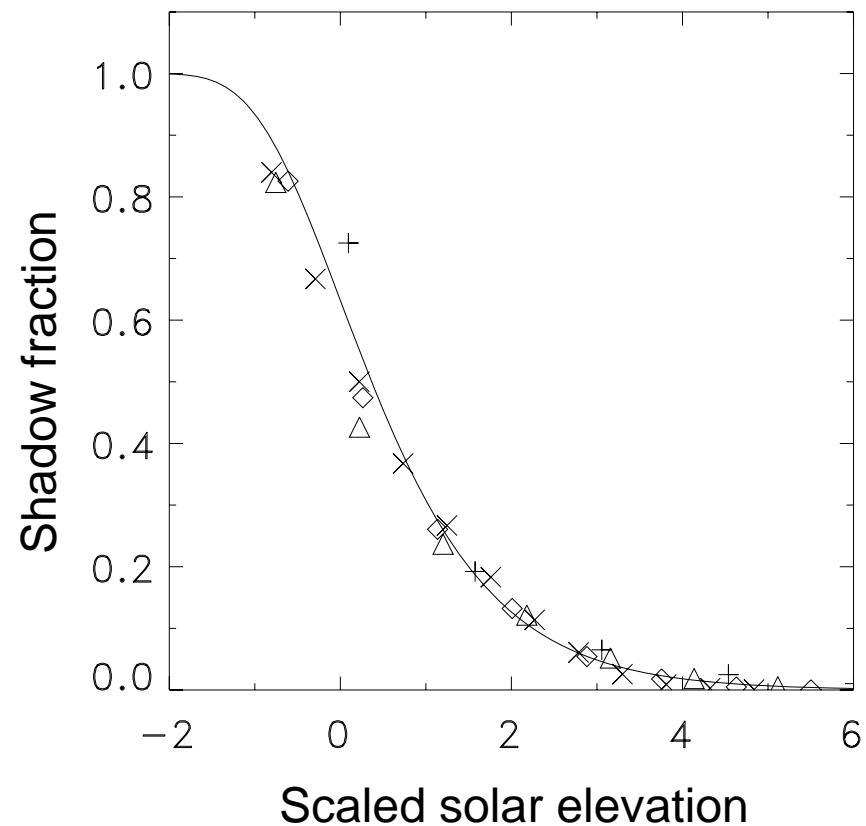

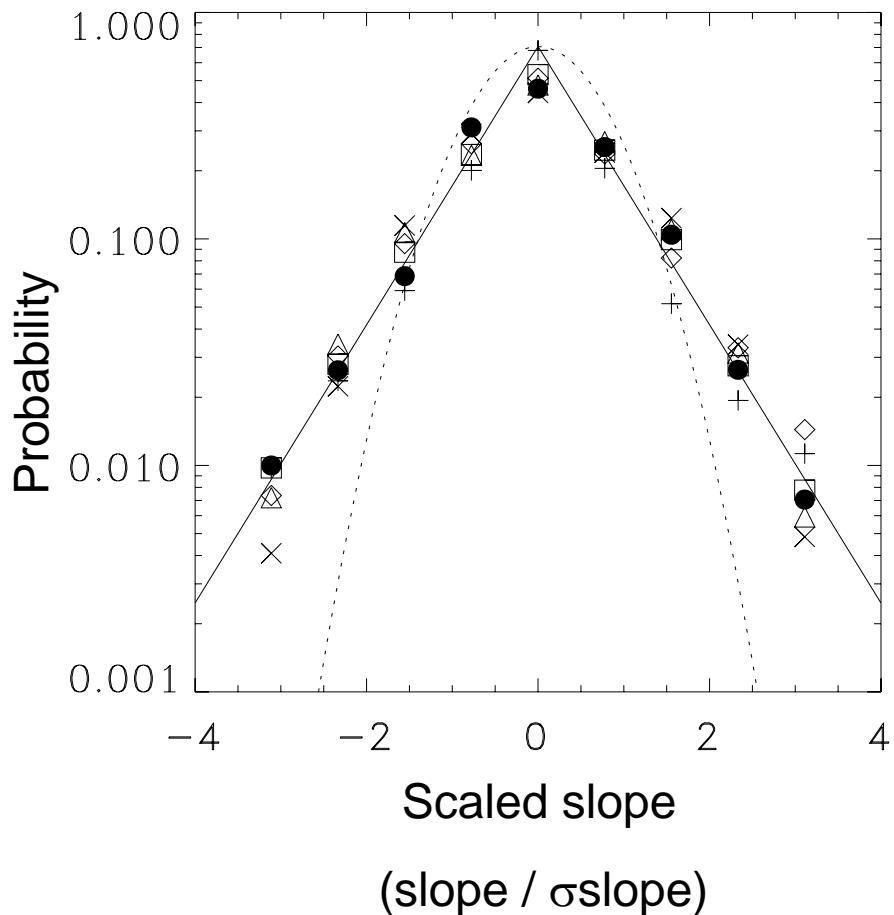

Shrub canopy gap shadow fractions

$$F_s = \frac{\bar{l}}{\bar{W} + \bar{G}} \quad l = h_c / \tan \theta$$

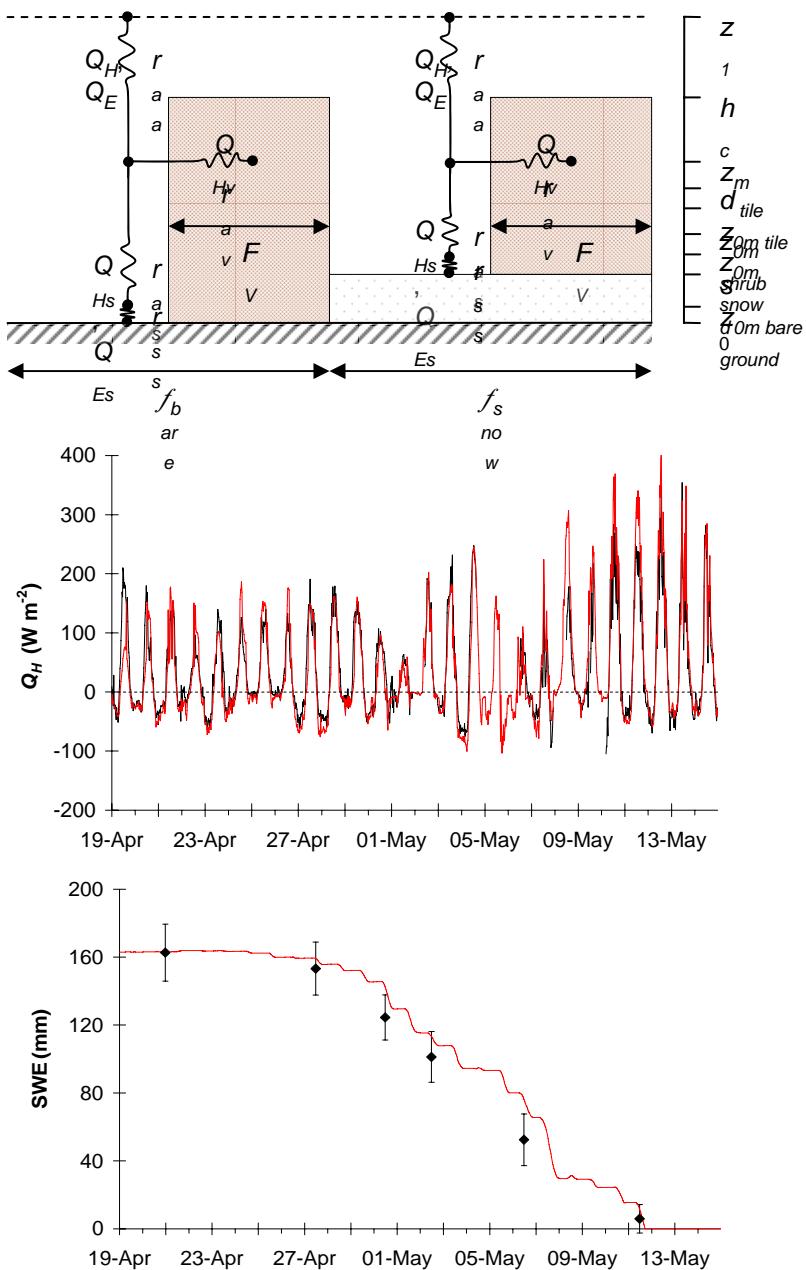

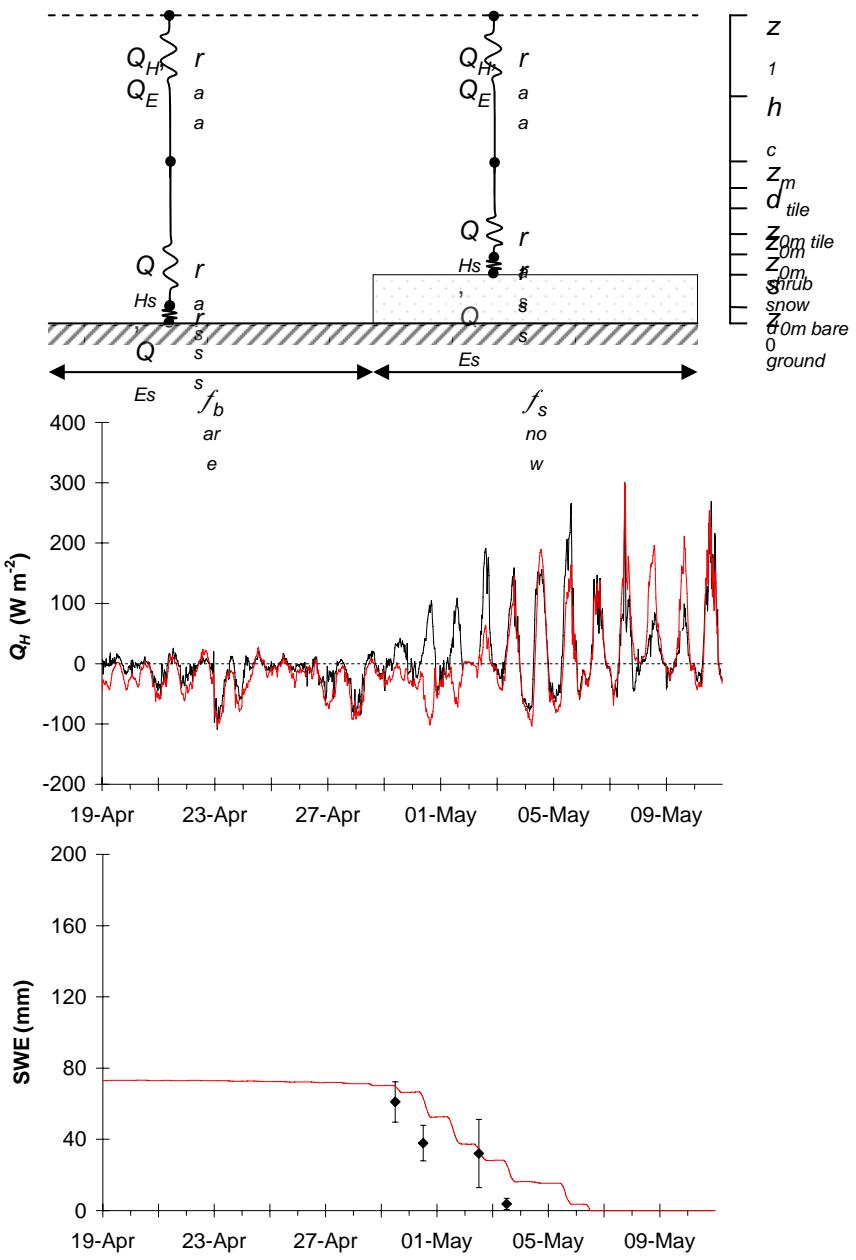

Parameterisation of shortwave radiation over topography

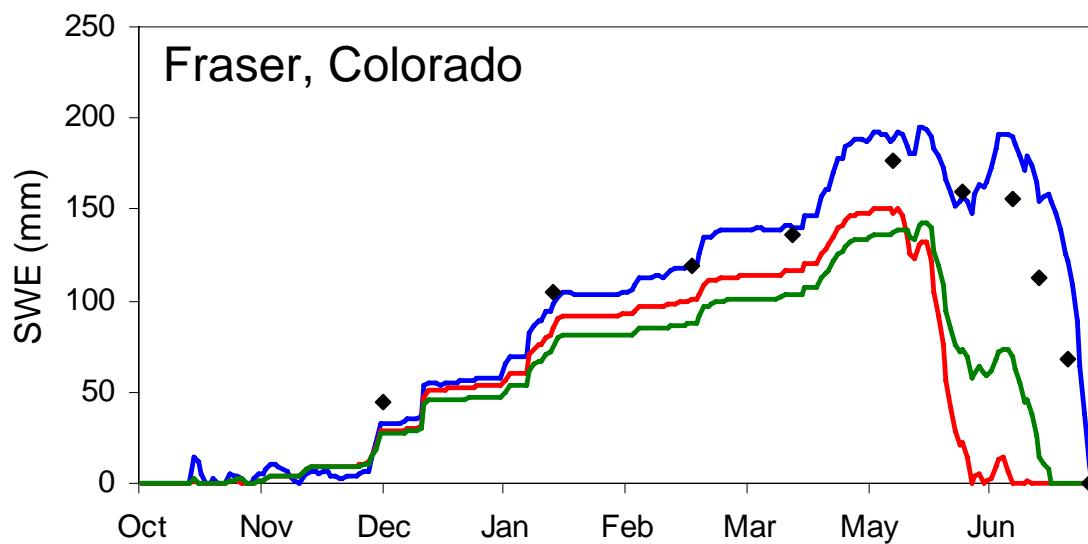

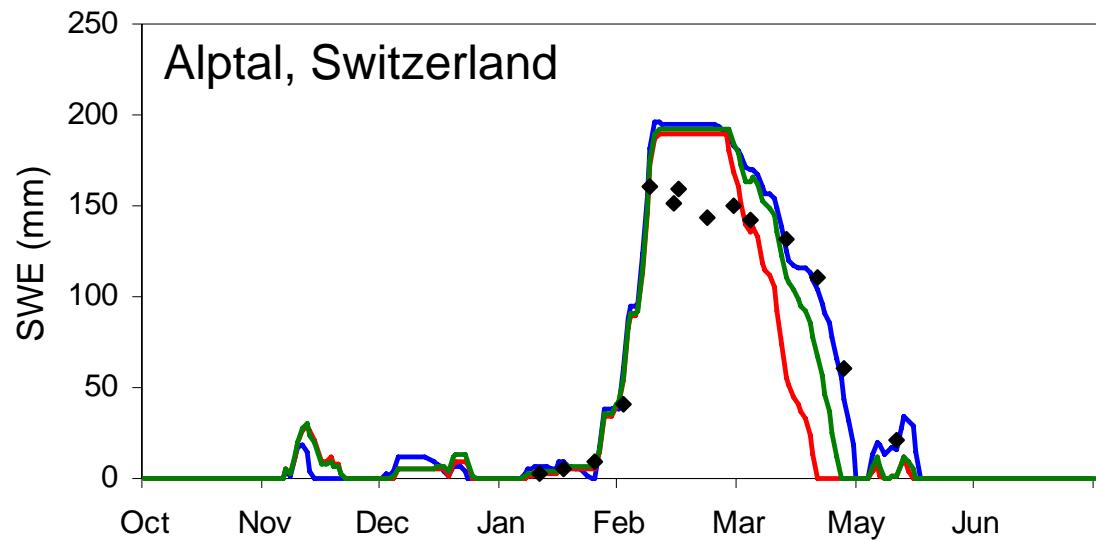

Granger Basin plateau

Theme 2- turbulent transfer

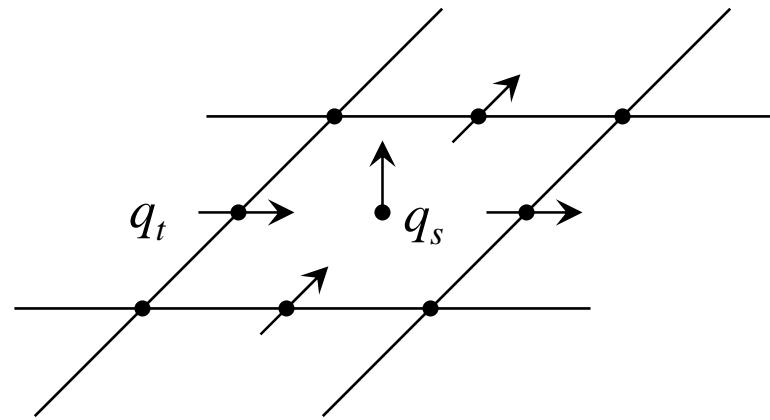

Granger Basin valley

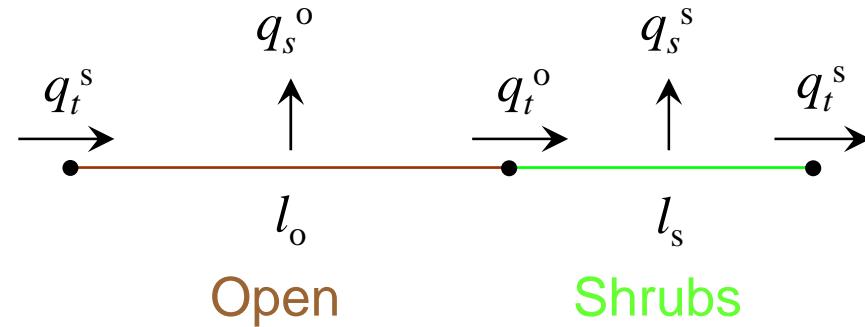

Forest snow model intercomparisons

Distributed model

Mosaic model

Distributed and mosaic simulations of snow accumulation
